

# PowerShell Cheat Sheet

## Variables

<code>\$var = "string"</code>	Assign variable
<code>[Type]\$var="typedVar"</code>	Assign strong typed variable
<code>[ValidateRange(1,9)][int]\$x=1</code>	Assign strong typed attribute controlled variable
<code>\$a,\$b,\$c = 0 or \$a,\$b = 'a','b'</code>	Assign multiple variables
<code>\$a,\$b = \$b,\$a</code>	Flip variables
Scopes	global, local, private or script
<code>\$global:var = "var"</code>	Assign global scoped variable

## Arrays

<code>"a", "b", "c"</code>	Array of strings
<code>@()</code>	Empty array
<code>1,(2,3),4</code>	Array within array
<code>,"hi"</code>	Array of one element
<code>\$arr[5]</code>	Sixth element of array
<code>\$arr[2..20]</code>	Return elements 3 thru 21
<code>\$arr[-1]</code>	Return last array element
<code>\$arr[-3..-1]</code>	Display last three elements of array
<code>\$arr[1,4+6..9]</code>	Elements at index positions 1,4, 6 to 9
<code>@(Get-Process)</code>	Force result to an array
<code>\$arr[((\$arr.length-1)..0]</code>	Reverse array
<code>\$arr[1] += 200</code>	Add to existing array item value
<code>\$b = \$arr[0,1 + 3..6]</code>	New array from elements of \$arr array
<code>\$z = \$arrA + \$arrB</code>	Combine two arrays into single array

## Associative Arrays (Hash tables)

<code>\$hash = @{} </code>	Create empty hash table
<code>@{foo=1; bar='value2'}</code>	Create, initialize hash table
<code>[ordered]@{a=1; b=2; c=3}</code>	Create ordered dictionary
<code>\$hash.key1 = 1</code>	Assign 1 to key key1
<code>\$hash.key1</code>	Return value of key1
<code>\$hash["key1"]</code>	Return value of key1
<code>\$hash.GetEnumerator   sort Key</code>	Sort hash table by Key
<code>[pscustomobject]@{x=1;z="z"}</code>	Create custom object

## Strings

<code>"\$var expand"</code>	String with expansion "
<code>'\$var no expand'</code>	String with no expansion '
<code>@"</code> Here-String <code>"@</code>	Here-String - quotes, expressions, etc. Single quotes for no expressions

## Comments, Escape Characters, Backtick

<code>#Comment</code>	Comment
<code>&lt;# comment #&gt;</code>	Multiline comment
<code>"A ""test""</code>	Escape char `
<code>`t</code>	Tab
<code>`n</code>	New line
<code>`</code>	Line continuation

## Basics of Text and Files

<code>Get-Location</code>	Get current directory
<code>Set-Location</code>	Change directory
<code>Get-Content</code>	Get content of file
<code>Add-Content</code>	Append content
<code>Set-Content</code>	Set content of file
<code>Out-File</code>	Formatted text to file
<code>Out-Null</code>	Discard output
<code>Out-String</code>	Convert to strings
<code>Copy-Item</code>	Copy items
<code>Remove-Item</code>	Remove items
<code>Move-Item</code>	Move items
<code>Rename-Item</code>	Rename item
<code>Set-Item</code>	Set contents of file
<code>Clear-item</code>	Clear contents of file
<code>New-Item</code>	New empty file or dir

## Objects

<code>(Get-Date).Date</code>	Date property of object from Get-Date
<code>Get-Date   Get-Member</code>	List properties and methods of object
<code>[DateTime]::Now</code>	Static properties referenced with "::"
<code>"string".ToUpper()</code>	Use ToUpper() Method on string
<code>[system.Net.Dns]::GetHostByAddress("127.0.0.1")</code>	Use static method to get host name with "::"
<code>\$excel = new-object -com excel.application</code>	Create a new Excel COM object to work with

## Flow Control

<code>If(\$x -eq 5){} Elseif(\$x -gt 5){ } Else{ }</code>	If
<code>\$x = 1; while(\$x -lt 10){\$x;\$x++}</code>	While
<code>For(\$i=0; \$i -lt 10; \$i++){ \$i }</code>	For
<code>Foreach(\$file in dir C:\){\$file.Name}</code>	Foreach
<code>1..10   foreach{\$_}</code>	Foreach
<code>Switch -options (&lt;values to switch on&gt;){ PatternX {statement} Default {Default Statement} }</code>	Switch

## Assignment, Logical, Comparison Operators

<code>=,+=,-=,*=,/=,%=,+=,--</code>	Assign one or more values to variable
<code>-and, -or, -xor, -not, !</code>	Connect expressions / statements
<code>-eq, -ne</code>	Equal, not equal
<code>-gt, -ge</code>	Greater than, greater than or equal
<code>-lt, -le</code>	Less than, less than or equal to
<code>-replace</code>	Replacement - "Hi" -replace "H", "P"
<code>-match,-notmatch</code>	Regular expression match
<code>-like,-notlike</code>	Wildcard matching
<code>-contains,-notcontains</code>	TRUE if value on right in array on left
<code>-in, -notin</code>	Reverse of contains,notcontains

## Other Operators

<code>-Split</code>	Split a string "abcdefghi" -split "de"
<code>-join</code>	Joins multiple strings "abc","def" -join ";"
<code>..</code>	Range operator 1..10   foreach {\$_ * 5}
<code>-is,-isnot</code>	Boolean - is object instance of specified .NET type
<code>-as</code>	Convert input object to specified .NET type
<code>-f</code>	Format strings 1..10   foreach {"{0:N2}" -f \$_}
<code>[ ]</code>	Cast operator. [datetime]\$birthday = "1/10/66"
<code>\$( )</code>	Subexpression operator
<code>@( )</code>	Array subexpression operator
<code>&amp;</code>	The call/invocation operator.

## Filter, Sort, Group and Format (aliases for brevity)

<code>dir C:\pub   where-object LastWriteTime -gt (Get-Date).addDays(-1)</code>	Files in C:\pub with lastwritetime greater than yesterday
<code>ps   where-object {\$_.path -like "C:\windows\system32*" -and \$_.company -notlike "Microsoft*"}</code>	Processes where path includes system32 and company doesn't start with Microsoft
<code>ps Explorer   select-object -Property ProcessName -ExpandProperty Modules   format-list</code>	Get explorer processes, select processname, expand modules property array
<code>ps   Sort-Object -Property WorkingSet   Select-Object -Last 5</code>	Sort Processes by workingset, select last 5
<code>"a","b","a"   Select-Object -Unique</code>	Return only unique - returns @(a b)
<code>Get-Service   Group-Object Status</code>	Group services by their Status
<code>dir   Group-Object {\$_.Length -gt 100KB}</code>	Group objects bigger/smaller than 100 KB
<code>Get-Content C:\pcs.txt   Select-String "q-"   sls "win7"</code>	Select strings with "q-", "win7" from pcs.txt
<code>ps   Format-Table -Property Name, StartTime -AutoSize</code>	Format ps output showing Name, StartTime properties, autosize the table
<code>ps   Format-table ProcessName, @{ Label = "Total Run Time"; Expression={(Get-Date) - \$_.StartTime}}</code>	Table showing processname, custom label/expression showing run time.
<code>Get-EventLog -Log System   Select -first 5   Format-table -wrap</code>	Get first 5 events in system log, wrap display
<code>gi C:\Users   format-list -property *</code>	Get all properties from C:\users in list format
<code>"{0}`t{1}`n" -f \$a, 5</code>	-f operator to construct strings. {0} replaced with \$a, {1} with 5 etc.

## Common commands

<code>Get-EventLog</code>	<code>Get-WinEvent</code>
<code>Get-CimInstance</code>	<code>Get-Date</code>
<code>Start-Sleep</code>	<code>Compare-Object</code>
<code>Start-Job</code>	<code>Get-Credential</code>
<code>Test-Connection</code>	<code>New-PSSession</code>
<code>Test-Path</code>	<code>Split-Path</code>

## Importing, Exporting and Converting

<code>Export-CliXML</code>	<code>Import-CliXML</code>
<code>ConvertTo-XML</code>	<code>ConvertTo-HTML</code>
<code>Export-CSV</code>	<code>Import-CSV</code>
<code>ConvertTo-CSV</code>	<code>ConvertFrom-CSV</code>

## Automatic variables

<code>\$_, \$PSItem</code>	Current pipeline object
<code>\$Args</code>	Script or function arguments
<code>\$Error</code>	Errors from commands
<code>\$True,\$False</code>	Boolean value for true,false
<code>\$null</code>	Empty
<code>\$profile</code>	Array of profile locations

## PSDrives

<code>Alias:</code>	Aliases in current session
<code>Cert:</code>	Certificate store for user
<code>Env:</code>	Environment variables
<code>Function:</code>	All functions in current session
<code>HKLM:</code>	Hkey Local Machine Hive
<code>HKCU:</code>	Hkey Current User Hive
<code>Variable:</code>	Variables in the current session
<code>WSMan:</code>	WinRM configuration / credentials
<code>AD:</code>	Active Directory
<code>Set-location HKLM:</code>	HKLM Registry hive
<code>gci variable:</code>	Variables in current session

## Regular Expressions

<code>\w</code>	Any word character [a-zA-Z0-9]
<code>\W</code>	Any non-word character
<code>\s</code>	Any whitespace character
<code>\S</code>	Any non-whitespace character
<code>\d \D</code>	Any digit or non-digit
<code>{n} {n,} {n,m}</code>	Match n through m instances of a pattern.
<code>More</code>	Google .NET Regular Expressions
